How to communicate?

- Sending data
- Receiving data
- Waiting for data
- Waiting for synchronization

UPPSALA UNIVERSITET

Outline Intro and motivation Code Body

Send and Receive Other P2P Funcs Communicators

Global Funcs

Timing

Datatypes Topology

Message Passing Interface (MPI)

- MPI is a library for data and messages passing
- ▶ The communication is explicit (the user specify what/how needs to be sent)
- The number of processes is configured at start up

A MPI program:

- ► Communication functions (Send/Receive/etc)
- C, C++, FORTRAN (+ interface to others)
- To run the program you need a run-time agent (mpirun)
- ► Example *mpirun* -*np* 2 ./*program*

Groups and Communicators

A group is an ordered set of processes.

Outline Intro and motivation Send and Receive Other P2P Funcs Communicators Global Funcs Code Body Datatypes Topology Timing

- ► Each process is associate with ID number called rank
- ► Processes can belong to different groups

Communicator object connect a group of processes in the MPI session.

► The standard (default) communicator for all MPI process is called MPI_COMM_WORLD

Global Funcs Timing Datatypes Topology

The following code compute the following

- ► Proc 0 sends data to Proc 1
- ▶ Proc 1 sends data to Proc 2
- . •
- ► Proc N-1 sends data to Proc 0

The data is a double value, where each process adds its rank. Thus, at the end the data will contain the sum of all ranks (0+1+2+3+4+...+N-1).

UPPSALA UNIVERSITET

Code Example

```
#include<stdio.h>

processors but then we need to do an explicit wait or ► The non-blocking receive does not block the test to check if data has arrived.

Send/Recv

Outline Intro and motivation Code Body

Send and Receive Other P2P Funcs Communicators

Global Funcs Timing

Datatypes Topology

We have four basic communication modes:

- ► MPI_Send, MPI_Isend Standard mode
- ► MPI_Ssend, MPI_Issend Synchronous mode
- ► MPI_Rsend, (MPI_Irsend) Ready mode
- ► MPI_Bsend, (MPI_lbsend) Buffered mode

Non-blocking calls returns immediately after initiating the suspends the execution until the message (data) buffer is safe to use (message has been sent/received/copied). All modes can be blocked -or- non-blocked Blocking communication.

D. Lukarski, J.Rantakokko, Jan, 2014, Uppsala

500

jilji

Note - Send/Recv

Intro and motivation Communicators
Send and Receive
Other P2P Funcs
Global Funcs Code Body Datatypes Topology Timing Outline

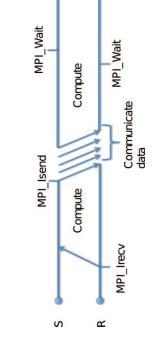

All send calls need to be matched with a receive call! and

Deadlock will occur if no matching send/receive!

Tips

UPPSALA UNIVERSITET Outline Intro and motivation Send and Receive Other P2P Funcs Communicators Global Funcs Code Body Datatypes Topology Timing

- ▶ Post a non-blocking send and a non-blocking receive as early as possible and overlap the communication with other computations.
- Using standard non-blocking send and receive is in most cases sufficient and gives good performance.

- Send non-contiguous data
- ► Reduce the number of communication calls
- ► MPI_Type_vector() regular distribution
- ► MPI_Type_indexed() irregular distribution
- ► MPI_Type_struct() different datatypes

Topology

Datatypes

► MPI_Type_vector(rows,cols,stride,old_type,newtype);

Makes a row x cols vector

Cols is number of contiguous elements for each row

Contents of the new array will be columns of original array

D. Lukarski, J.Rantakokko, Jan, 2014, Uppsala
